NH₃ as a Liquid Carrier of Hydrogen

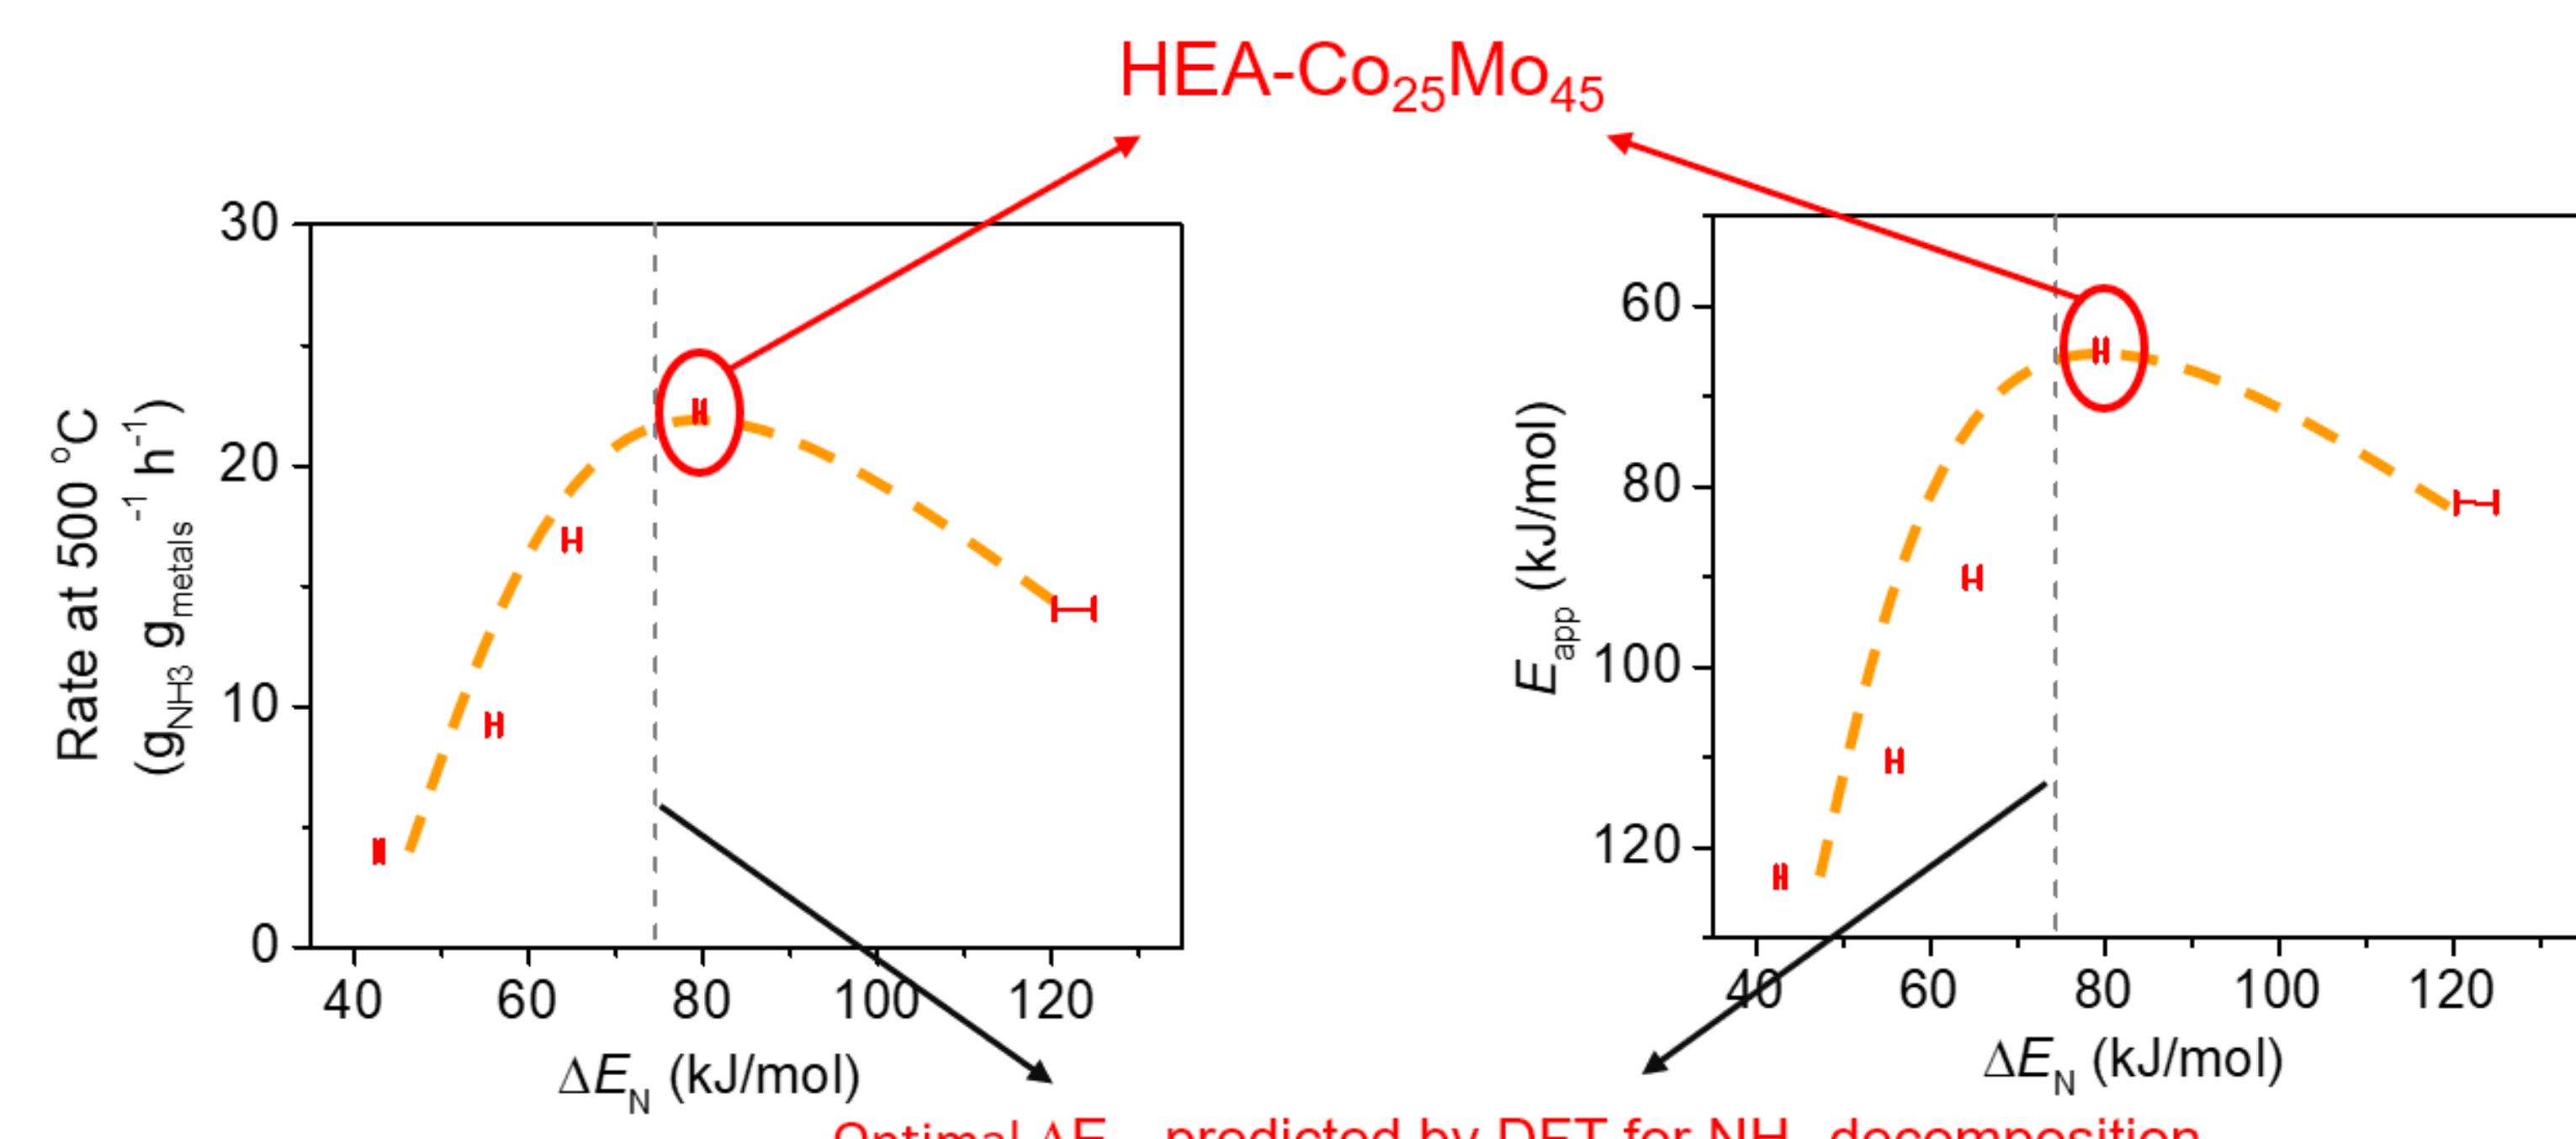

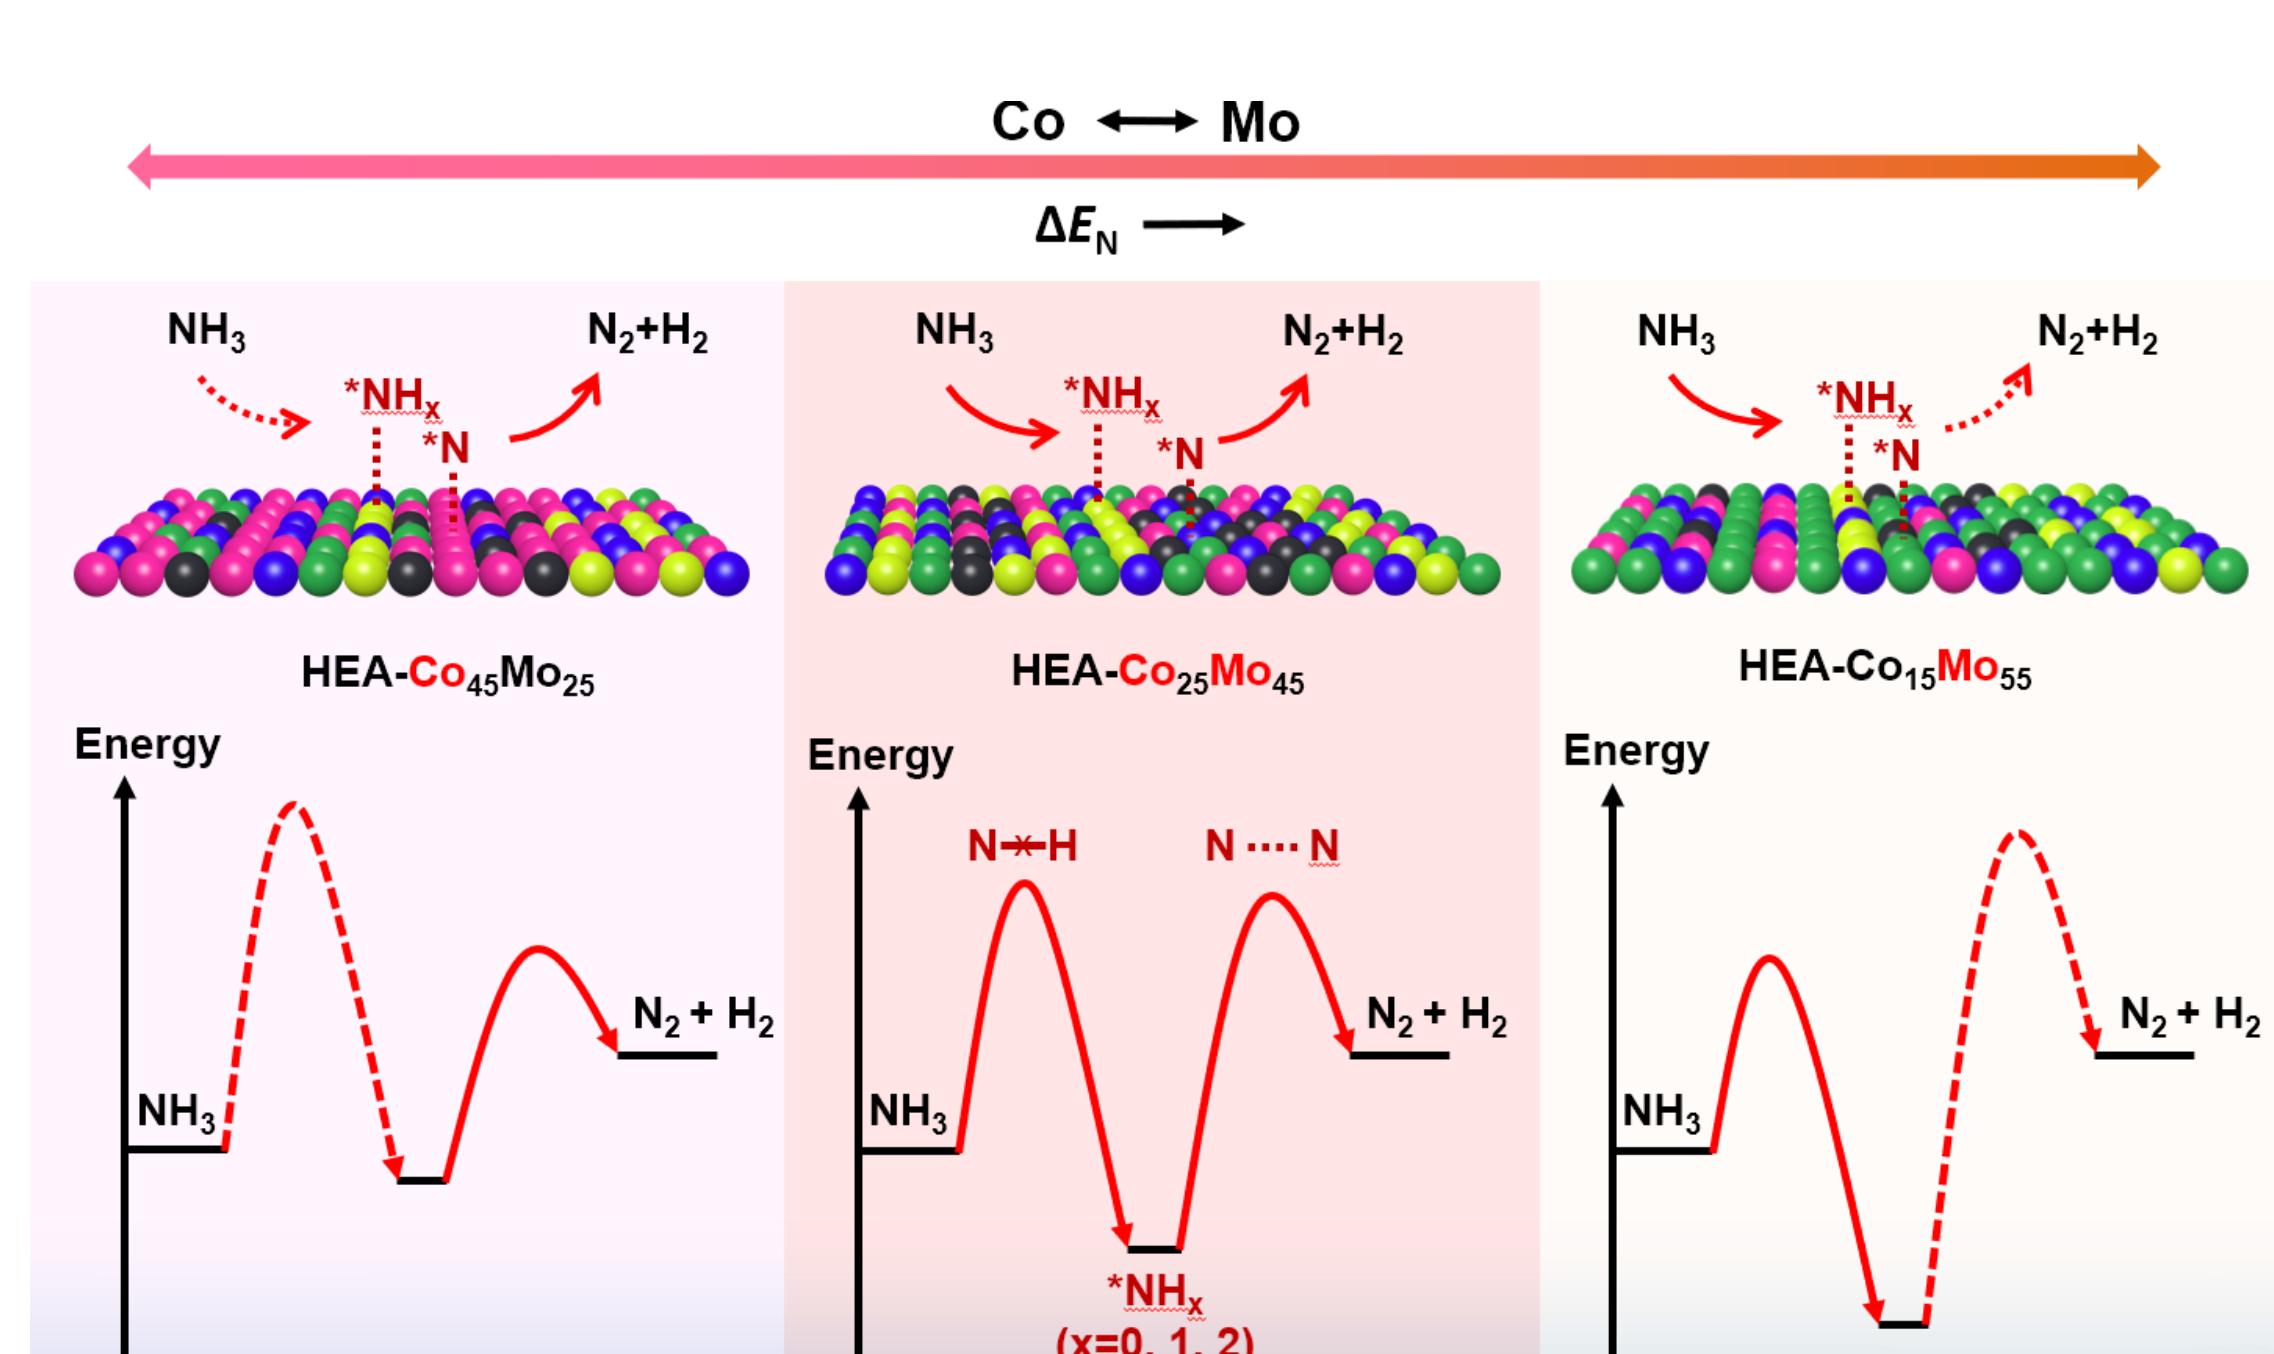

- **High energy density and high specific energy**
 - 4.25 kWh/L
 - 5.2 kWh/kg
- **Easy to liquefy**
 - >10 bar at room temperature
 - or below -33 °C at atmospheric pressure

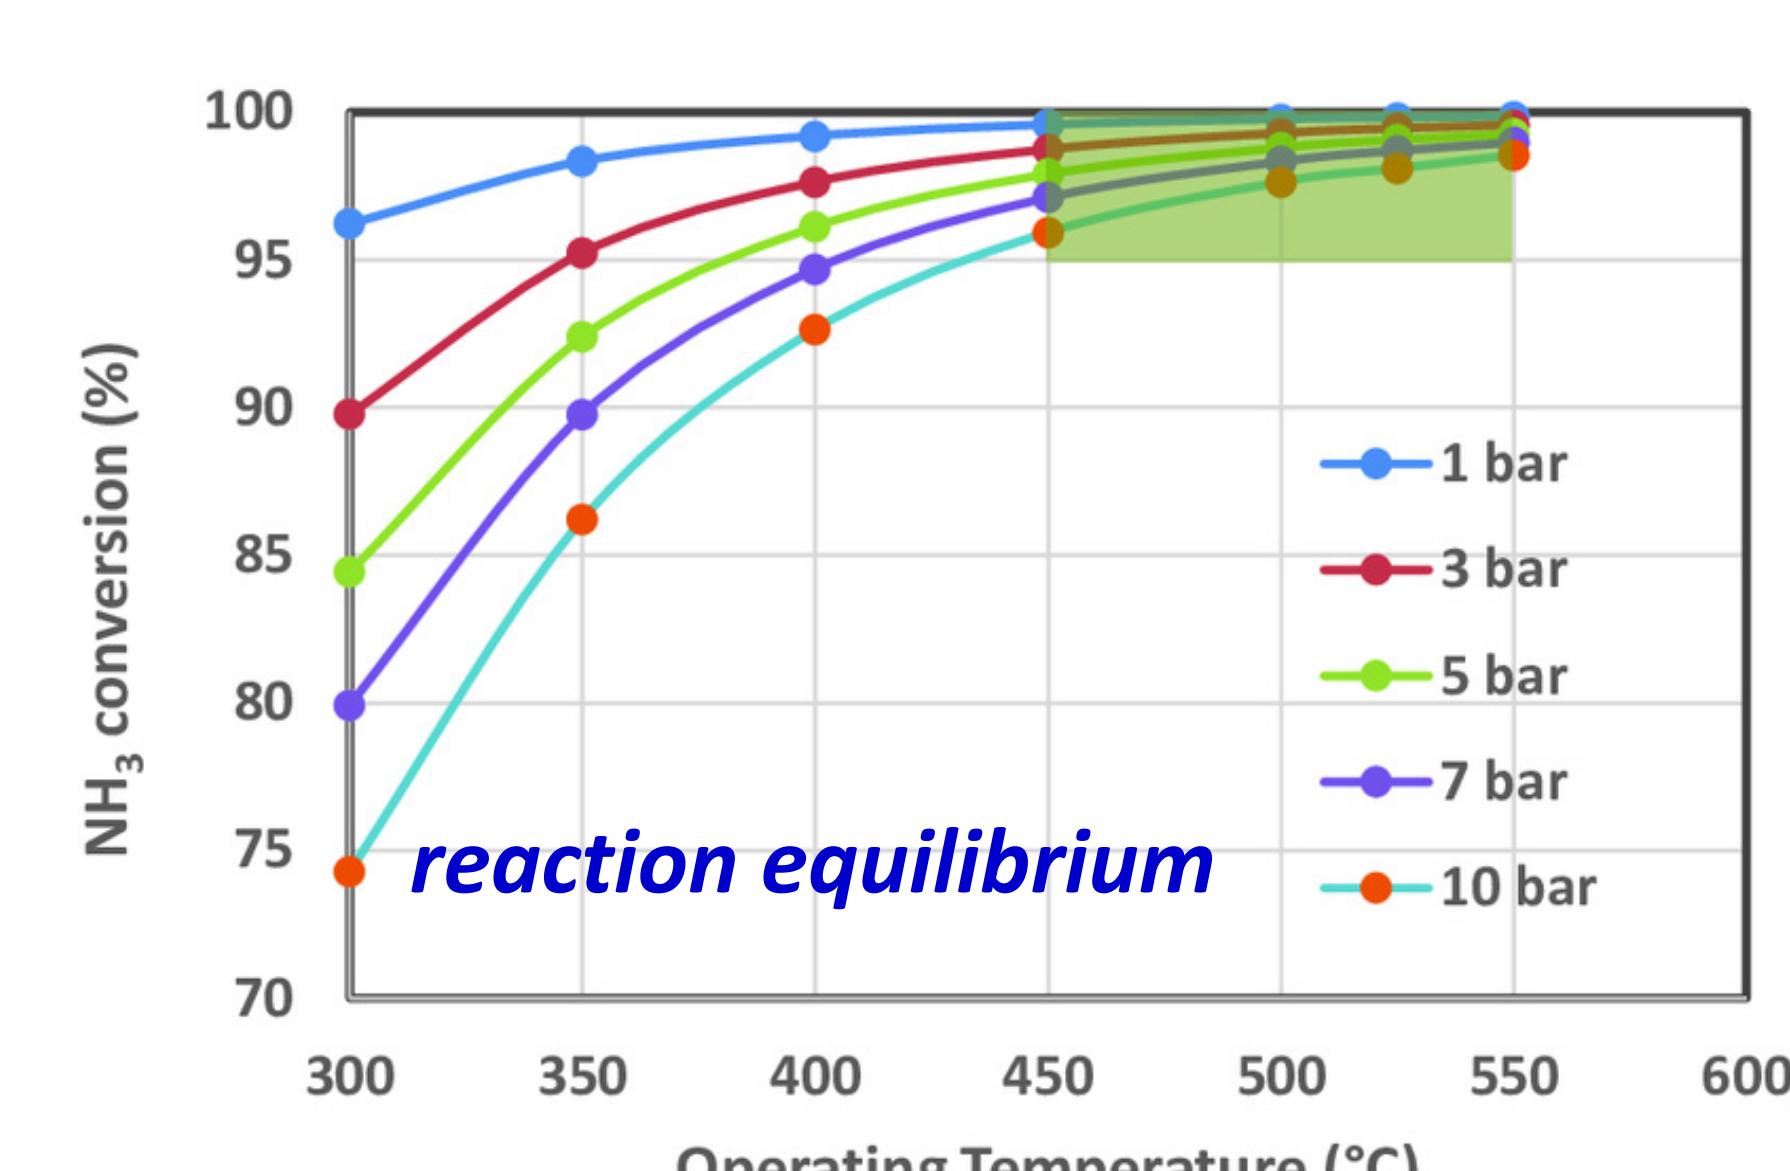

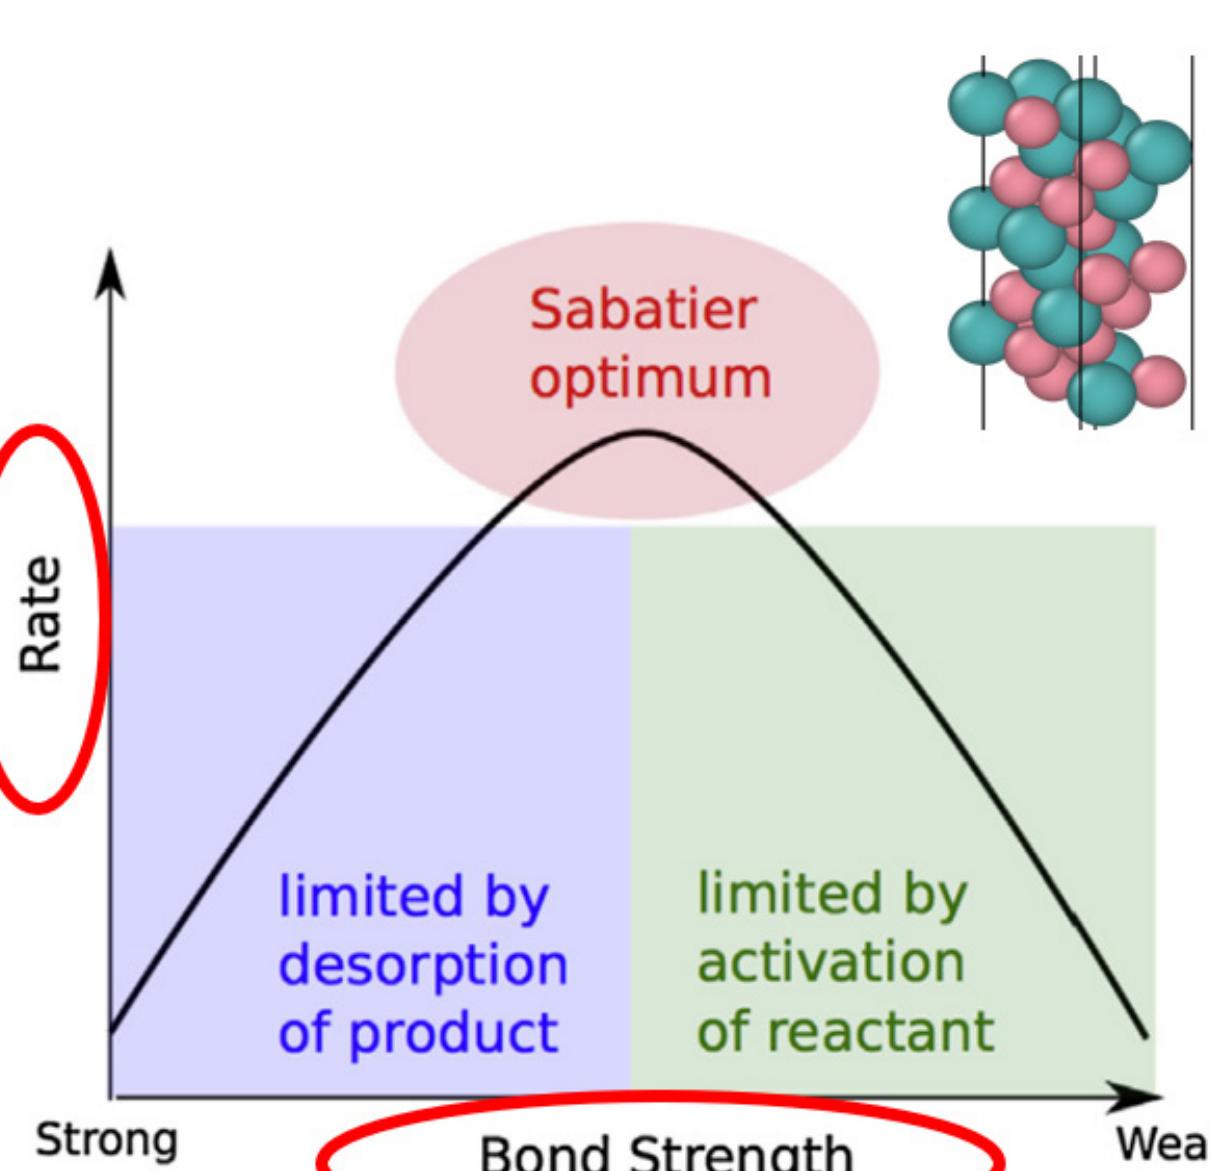

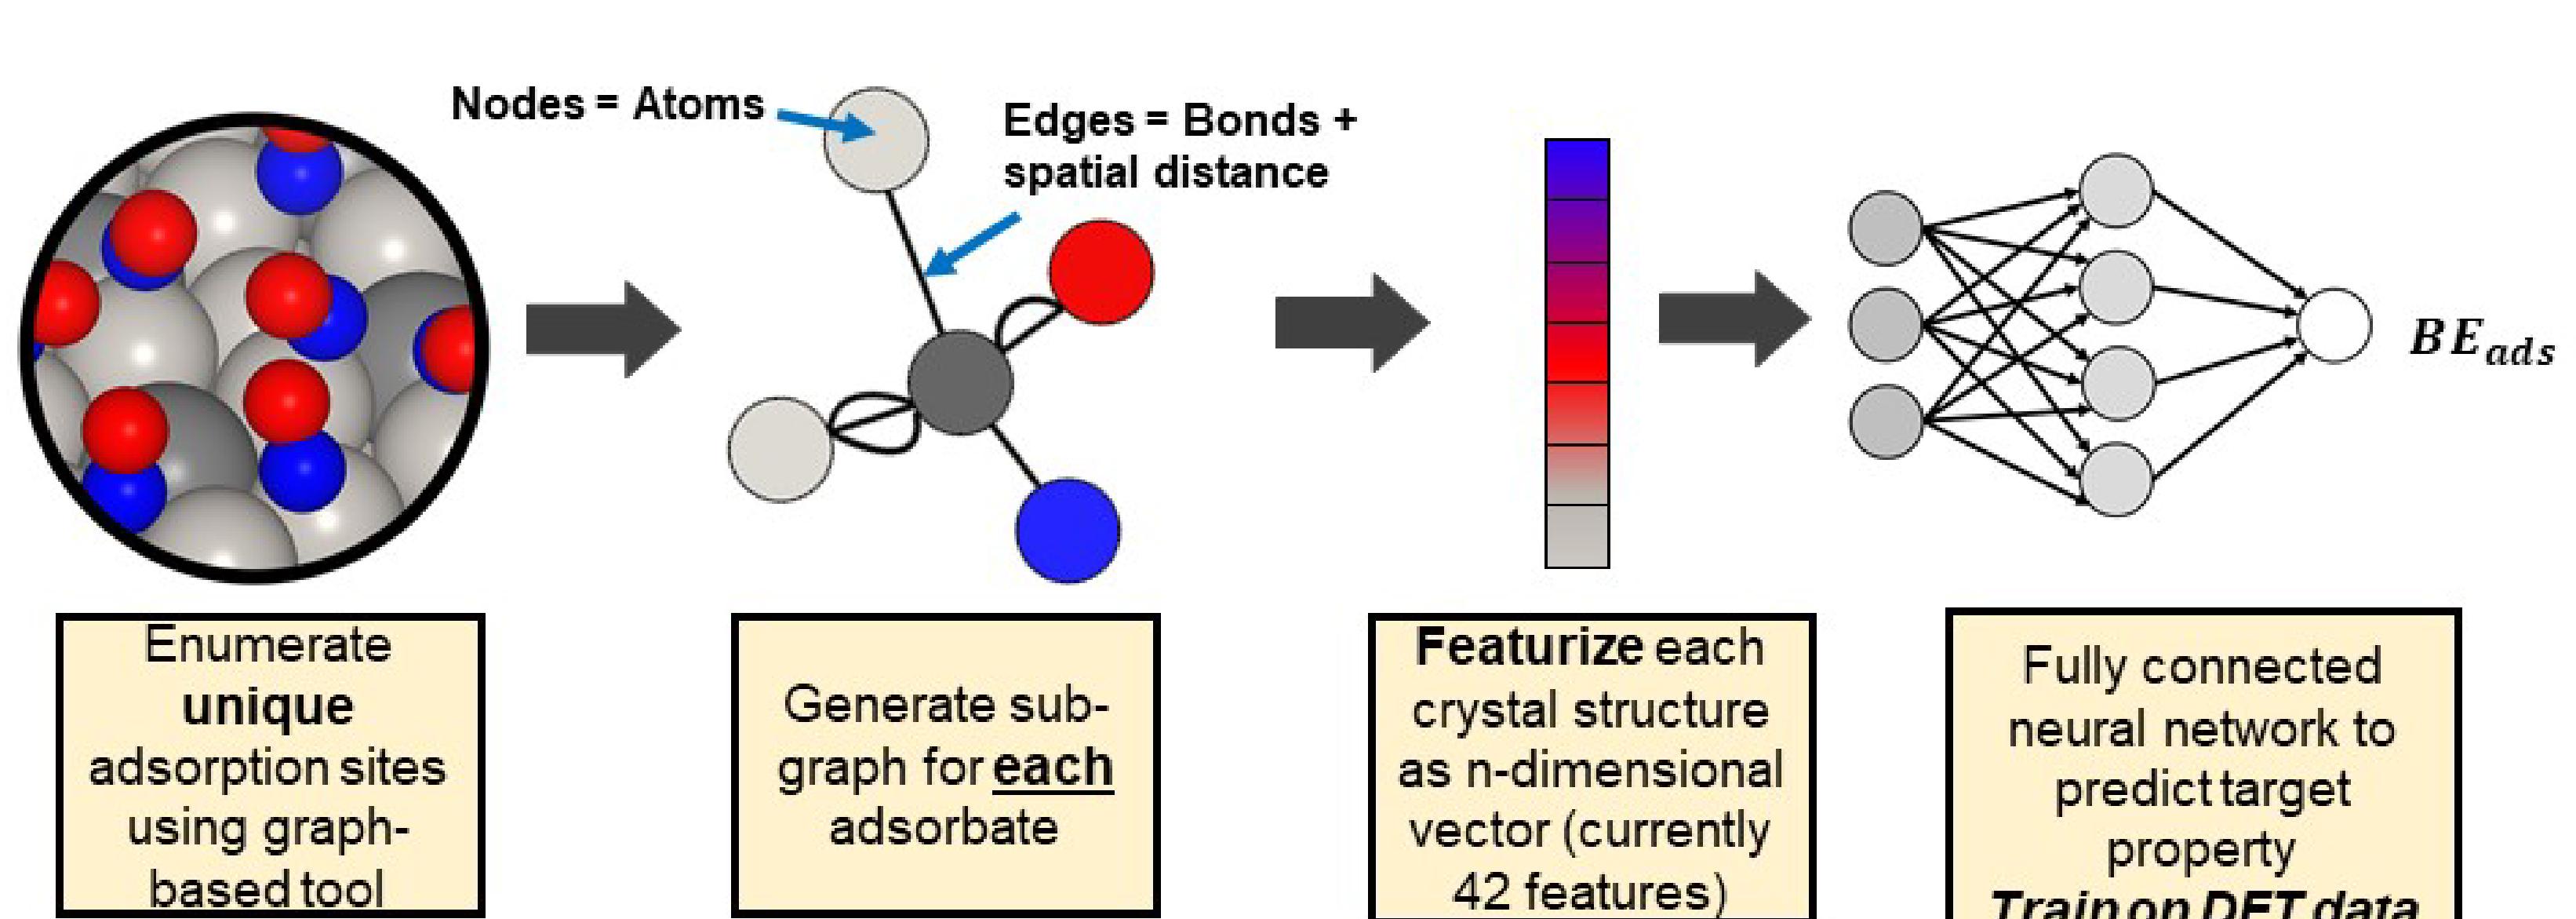

High-Entropy Alloy (HEA) Catalysts for NH₃ Decomposition

- Robust tuning of alloy compositions and mitigation of miscibility gap
- Optimization of surface properties for catalytic enhancement

Machine Learning for Predictive Simulation of Composition-Property Relationships
